

- We need to **work interdisciplinary** to be able to **solve the complexities of the future problem**,
- We need to **break the silos**, get used to **going beyond our familiar subjects** and work in **integrated subject areas**,
- We need to identify our **faculty-DNA making us unique** (compared to the other faculties),
- We need to **identify the synergies/overlap** between subject areas, department and faculties,
- We need to have a **perspective on all our three/four missions** (research, teaching, FOMA and collaboration),
- We should take the **insights** from our history, faculty and SLU strategy, and KON2018 into account,
- We need to take into account **the context that each subject area belongs** outside the academy,
- We need to work out **ways for communication** between groups (subject groups, etc.)
- We want **flexibility, stability, quality, relevance, attractiveness** and a **long term** approach in our subject areas,
- We need a **reflective approach, looking inside-out and outside-in, communicate with each other and create understanding** for each other and subjects,
- **Our individual approach**, mindset and our ability to change and synthesize different subjects within research teaching, research, etc. plays an **important role for how we proceed and succeed** in this development process.
